

Billing Conversion problem

15/11/2011

We have found that in at least one site (Dr Ancilla McGoldrick) the billing conversion does not finish properly. The conversion appears to have no problems but the last number of bills do not convert. This occurs if the number of billing records exceeds about 70,000.

If it happens you will notice that patients born in the latter months of the year eg born any day in December or November perhaps, will not have the bills converted.

We have a solution to this in version 7.2.0.1375 of Health one.

Proceed as follows:

1. Use the tool `c:\honewin\bin\HoHCREditTool.exe / hdmpepert`

Note the parameter `/hdmpepert`

Use the function "Billing module: undo conversion"

Select what kind of process you want to do

- Replace an HEALTH one item with another
- Add a subscription transaction to the HCRs
- Add an item in all administrative transactions
- Update patient table with administrative data
- Validate all temporary transactions in the HCRs
- Update GMS numbers
- Replace HEALTH one codes with other (Item, content, ...)
- Anonymise HCRs
- Replace an HEALTH one attribute value with another
- Reset HEALTH one 3.6 Hcrs to HEALTH one 3.5 Hcrs
- Create administrative portable file from the identification transaction
- BSK : Create vaccinations transactions from laboratories
- Billing module : Undo conversion
- Bulkies: check, correct and compact each bulky
- Replace the user name
- IRT on a selection of HCR

In the following screen, untick the option "undo billing" and tick the option "list of already converted HCR". Click next and run the program on the server source which has all the billing up to date. Remember to synchronise any remote sources to the main source before doing this.

This will go through the entire patient list and export a text file containing the names of patients who **have been converted already**. This list is stored in `honewin\logs` and will automatically be used by Health one the next time you run the main billing conversion

- Undo billing conversion
This command will update the billing items in all existing HCR.
- List of already converted HCR:
This command will list the HCR that have already been converted

Click Next to continue...

`c:\honewin\Logs\ConvertedPatient.txt`

When this process is finished (may 20 mins max), open Health one and run the billing conversion again. Health one will first read the text file above and ignore all those patients. It will convert only those that have not already been converted.
