Search on any part of the drug name- tick this is you want to be able to find drugs in the selector by typing any part of the name...but even better, leave it unticked to make searches start with the beginning of the drug name and just just add a space before the letters you are searching for if you want to search on any part of the drug name-best of both worlds. Great for nu-seals, accucheck aviva etc. Try it!

Search on empty value-untick if you want the Rx Module to open faster

Set **Default Repeat Number** to les s than this!

Apply to all drugs to change this for all repeats.

Display overdue repeats in red can help you check compliance and weed out drugs that are no longer used from the list of repeats

How the **CTRL** key influences the prescribing process. Great if you don't want to edit drugs every time you prescribe them from the selector.

Opt out of commercial prompts

Printing stopped drugs can be useful depending on which report you choose from the printing dialogue-you can have stopped drugs print with 'STOPPED' written after them or as a strikeout.

Prescription module

- Data exchange module
- Appointment
- Inability to work
- Billing
- Multimedia association
- Scanning
- Drawing
- Live update

Search options
- ☐ Search on any part of the drug name
- ☑ Search on empty value

Miscellaneous
- ☑ Stay active for 28 days
- ☑ Insert prescription at the end of the transaction
- Default repeat number : 99
- ☐ Apply to all drugs
- ☑ Display overdue repeat prescriptions in red
- Default delay for prescriptions : 28
- ☐ recommended titration schedule

Drug set
- ☐ Propose the drugs matching the disease
- Item used : assessment

Layout
- ☑ Display the top right grid (Chronic prescriptions)
- Default grid : Repeat prescriptions
- Left view : Irish speciality (IPU)
- ☑ Display allergies grid
- ☐ Display personal notes to the right

Enter Key
- ○ Prescribe the drug (Expect if the posology is not defined) **CTRL+ENTER ou CTRL+E = Edit**
- ● Edit before prescribing **CTRL+ENTER = Direct Prescription**
- ☐ Direct prescription from a drug in the HCR

Alerts
- Interactions alert level : Potentially serious interaction
- ☑ Display an alert dialog
- ☑ Disable when prescribing from the repeats
- ☑ Display GMS Expiry Date
- ☑ Display specific drug alerts
  - ☑ DuoPlavin alert   ☑ Dovobet/Dovonex alert
  - ☑ Fosamax alert   ☑ Twynsta alert
  - ☑ Acerycal alert
  - ☑ Nebilet alert
  - ☑ Exforge alert

Print options
- ☑ Show print dialog   ☐ Print stopped drugs

Search forms
- 1 : Practice formulary
- 2 :
- 3 :
- ☐ Auto add a drug to the default search form

Default   OK   Cancel

Some Issues:

Bespoke posologies written using the free text poslogy editor are not currently displayed in template letters.

Private database drugs are not included in the interaction checker

Some template letters, as currently defined, do not provide accurate and full details of the poslogy and can only be relied on to provide the drug name. (To address this, you need to use the template analysis 'repeats' . If you need further detail to be displayed this can be customised in the Composed Display Editor in template analysis and the refined analysis embedded in your template letter.

Desiderata :

We did wonder about allowing drugs of a class to clump together.

We did consider that having a field (perhaps even a mandatory field for some drugs) that allows/encourages the prescribed to record an indication and a proposed duration of a repeat drug, over and above the remaining repeats setting would be ideal.

Where you only want to printy one drug from a list (ISTIN in this case) normally just highlight that drug **EXCEPT** for nthe first drug in any list or to print *only* the drugs in a second or subsequent prescription rather than all prescriptions for this transaction, you need to tick **Print only selected prescriptions** (or press Alt-T)

Edit the prescription

Callout (top center):
Select Rx Module Options from here too.

Callout (left, red):
Use the **Private Database** to add new 'drugs' to allow recording of special notes like 'NB-dispense weekly' or 'NB-benzodiazepine Rx reviewed and sanctioned'…

Note private database is local to the computer and is not available on the network

Callout (right):
Here's a generic name- need to check what it is?- right click select 'equivalents', but this gives a filter in the selector, that seems to be stuck. Solution is to just momentarily select private database afterwards and then back to the generic or IPU database and the filter is cleared

Callout (green, bottom left):
Use the database option **Practice formulary** to create a database of all drugs prescribed by you ever, and then start a discussion about which ones you might remove from a practice preferred list to create a meaningful formulary.

Callout (center):
Creating multiple prescriptions in the one transaction is handy for the things the patient only remembers on the way out the door or for controlled drugs.

Callout (right center):
Drug Take is a great way to print a list of drugs, add indications and times for dosing to give to the patient

Dialog box:
Search form initialisation

This procedure will search in your patient database in order to extract the drugs you have prescribe in the past.

The search form includes all the drugs that you prescribed in your day to day practice

Do you want to scan your patient files and initialise your search form?

If you don't want to initialise the search form now, you can start this procedure again using the main menu Prescription / Initialise the search form

Yes   No
